

**Prairie Sandreed – Sun Sedge Herbaceous Vegetation (Map Code 3.3)**

*Location:* This type is found on the nearly level to gently rolling sites within the sandhills portion of the Refuge. Large stands occur in the southwestern portion of the project area.

*Photo Signature:* Beige and glossy, almost smooth in appearance (low density of soapweed yucca). A distinct lack of white speckles may be an indication of the more stable nature of this type.
